Can we say f is uniformly continuous on C ? And if not, why? A: If f is uniformly continuous on C then f is continuous on C as well. And since C is compact, f is bounded on C (by the uniform continuity). But if f is bounded on C , then it must take its value in the compact set $D := \{x \in \mathbb{R} : f(x) \in [-M, M]\}$. As $C \subseteq D$ the continuity of f on C follows (I assume we are allowed to use the existence of a function extension theorem). Alternatively one can argue with the extreme points of C : If f is uniformly continuous on C it is continuous at the extreme points of C , e.g. at a point $c \in C$ we can find a ball around c on which f is uniformly continuous. As C is compact the union of such balls contains C , and since f is bounded f is continuous on C . A: No, f can be unbounded, even on a closed interval. There's a book waiting to be written about the wild success of the BBWAA voters,
