The computation of the apparent heat capacity from the initial state at 273-273.5K through the folding transition to the DSC heat capacity maximum is possible using the following equations. The apparent heat capacity in the range 273.5K to 400.5K is given by: In the differential form, we get The following formula has been used to find the apparent heat capacity. For thermodynamic calculations, the apparent heat capacity is estimated using the following formulae: $C_p \text{ }^\circ\text{K apparent} \text{ }^\circ\text{K apparent} \text{ }^\circ\text{K}$. The apparent heat capacity, in Joules per mole, of the protein is then calculated as follows:. 2 epub ahead of print. PDF/EPUB 2009. xml. The apparent heat capacity is an ideal tool for the estimation of the protein's stability. Data indicate that the major reason for the kinetic destabilization of this protein is due to the increased heat capacity of the unfolded state with respect
