I read the file using numpy.loadtxt and wanted to use the below code: new_list = [] for row in np.genfromtxt(open('data.txt'), delimiter=',', usecols=1, dtype=float): new_list.append(row) My data.txt file is like: 1,0.35729,0.61561,0.85966,0.73376,1,1 2,0.5928,0.93514,0.4955,0.85966,1,1 3,0.76633,0.89612,0.4,0.93514,1,1 4,0.67758,0.61849,0.5,0.93514,1,1 5,0.76633,0.89612,0.4,0.93514,1,1 6,0.76633,0.89612,0.4,0.93514,1,1 7,0.76633,0.89612,0.4,0.93514,1,1 8,0.64108,0.56762,0.62145,0.99405,1,1 With above code I am getting the whole data.txt. How do I get just the below data? 7,0.76633,0.89612,0.4,0.93514,1,1 8,

At the time it should be a way to make the speakers/headphones usable with the computer. And yes, I do not want USB sound devices, A: The HV-G61 is not a real "speaker/headphone combo" but a USB-powered accessory used with Windows Vista's Sound Recorder application (and, presumably, others). In other words, it is not designed to be used as a speaker driver in Windows. As a speaker driver for Windows, the HV-G61 will only work on PCs that have Windows XP or Windows Vista. It won't work with Windows 7 or Windows 8. If you bought a speaker driver for Windows 7 (or Windows 8), you shouldn't try to use it on a computer running Windows Vista. The driver was specifically designed to work with Windows Vista, and will not work on any other operating system. If it doesn't work, you can contact the manufacturer for a refund. Further reading: Amazon: HV-G61 Ultrasonic Sound Device Windows Central: HV-G61 USB Speakers Can't Be Used As Headphones On Windows 7, Windows 8 HV-G61 product description at Havit: Perfect Solution for Surround Sound and other USB applications (Windows XP, Vista, 7 and 8). Compatible with most USB sound device drivers (such as Microsoft). Further, it appears that the HV-G61 comes with a 3-month warranty, so you have a 60-day window to return it if you don't like it. And just to be sure, Consumer Reports says that you can't even use it with Apple's Macs. Q: How to make this POCO using EF4 work? MVC4, EF4, POCO I've a MVC3 POCO class library for managing data. One of the things the library does is offer a context and a repository factory. The POCO context maps the basic entity (to simplify) to a MVC3 object, and the factory then takes that object and maps it to more complex POCO objects. Goodness knows, the business logic that's gone into this is huge. But here's the crux. Say I have a Person (a basic POCO) table. That has a
