Yes Gen 1..Subgrouping of renal sarcoidosis by high resolution CT. The aim of this study was to investigate the CT findings of biopsied renal sarcoidosis in order to subgroup its macroscopic appearance. We retrospectively analyzed the preoperative CT and histopathological findings in 22 patients (17 women and five men; average age, 47.2 years; range: 20-76 years) with biopsy-proven renal sarcoidosis. The 22 patients underwent a total of 24 renal operations (three open, 21 laparoscopic). We subgrouped the renal lesions into tubular, papillary, or mixed types according to the CT findings, and we investigated how these CT findings could help in the preoperative evaluation of the patients. The CT findings showed macroscopic solid and cystic renal masses, containing multinodular filling defects, and they corresponded with renal sarcoid granulomas. The CT findings showed microcysts in tubular sarcoid lesions, and the tumors were c6a93da74d
