The custom functions in the Filter menu are ideal for fine-tuning specific tasks such as converting a number of pixels to a percentage, suppressing color, enhancing or reducing the contrast, and much more. You usually won't need to use the custom functions for most things. Let's take a look at each of them and why you would use them. Photoshop gets a little confusing with its actions, presets, and many different ways to do the same thing. But even if you never touched the actions editor, you'll learn what they are and how they work when you create or edit a RAW file in Lightroom. Lightroom 4 makes it easier than ever to perform advanced editing tasks on your images. From removing red-eye to shooting RAW images, you can utilize Photoshop's new camera-specific functions to improve the quality of your images even when you're not in Photoshop. Want to remove the color on a certain part of your image? Now you can do it in lightroom.

Like many post-processing actions, you can choose a number of specific presets to get you started, and then adjust the settings yourself. But Lightroom is about more than just post-processing. It is about optimizing your workflow, and optimizing your workflow means keeping all of your information in one place. When you link Lightroom 4 directly to your Lightroom 5 catalog, you'll be able to quickly move your settings and selections from one Lightroom to the next. This will help you do things like edit with multiple images at once, or share settings across different suites of equipment. Linking to your catalog also gives you the ability to create presets and edits specifically for a given camera model without having to export the camera Raw file. 933d7f57e6
