If a mistake was made, you can always correct it. Photoshop addresses this feature by completely erasing all the layers and creating a new layer. Thus, you can adjust all the layers simultaneously and work your way back up if an issue is found. Photo DNA is a new tool that is built in to Photoshop. I am not sure whether it has been available before under a previous version of Photoshop as this review platform, but it is new for the current version. This tool can scan and identify your subjects on your photo as well as tag the moments of your life into frames. I am sure you all have known the lightning realization of a life moment as you snap a photo with your smartphone. All you have done is clicked on the gadget to take a picture. Now Photo DNA can do that, but only when you enable it in Photoshop. Perhaps it can learn over time, but we will not know that until sometime in the future. At the moment, you do not need to own up to your identities as part of the Photo DNA process. It does, however, automatically tag you in the file name with the place or the people. It will not automatically tag people, but rather just places. You can edit the automatic tags, or add your own at the same time. I suppose the best part of Photo DNA is the fact that it is built in to the application. No extra software is needed. You do not have to go to a website to grab that Photos DNA tool. You just have to check a box and start working. So there's that. Remember all those interesting GIF animations you've stored on your desktop back in their 14-bit glory? Well, 10 years later, Adobe wants to bring those back to life. The new Photoshop October update will let you apply an animated GIF directly inside an image. Photoshop used to have the ability to use an animated GIF as a still image, which allowed you to import, edit, and save it either as a still image or as a GIF. However, the process was a bit convoluted. Now you can simply drag and drop images into the "GIF" window, and you can edit the GIF image as any other type of still image. The animation highlights mode also remains, and it is as useful as it ever was but I do miss the ability to add curves to an image through Photoshop. The ability to create and edit GIFs is important as a new online destination for file sharing comes out on a regular basis. You would not want to use a file that is not ready for sharing.

But that also means that there are plenty of legal reasons for using pixels animations as well. That makes perfect sense to me, because who would want to walk around with a 1:1 copy of the historical Keith Haring painting in his head. A professional photographer would see nothing comparable to that on a photo, but for someone who spends a lot of time playing around online and uploading photos to online communities, it is important to have an animated GIF ready for sharing, and this trick makes that simple. So, as you can see, Photoshop has gained some useful features and new tools that are poised to awesomely change your workflows.
