One of the biggest changes in Lightroom 5 is the addition of the new Quick Develop feature. You can see how your image will turn out right in the Live Preview workspace, aided by a special Mode panel. Open Mode allows you to choose Special Effects (including Noise Filter, Sharpening, and vignette), Overlay, and Lens Correction as separate modules. Overlay lets you manipulate the image to create visual effects--such as blurring or retouching eyes in portraits--to suit your creative needs. Lens Correction can be used to assess or correct aberrations in the lens--no time for that, more likely, but an interesting experiment nevertheless. Lightroom 5 comes with several new features, such as the ability to change settings on the go (rather than having to open the dialogs elsewhere) and Export Master Settings, which allows for a simpler way to quickly save and/or share settings. For the first time, there are a couple of ways to make RAW images open faster. In addition, the default mode for raw-image export is set by a developer setting, which can be changed to "Fast" or "Light." Of course, you can also Control Panel and select Fast, but the feature should be made available to Lightroom's users by default. The bulk of the new features are aimed at helping users with image organization. You can use mixed files (ones with both RAW and JPEG versions saved and used right next to each other) to view images. Just about everything is category- or collection-based. For instance, use the Organizer's Tag Browser to create stacks of images organized by color, subjects, objects, or more descriptive categories.
